Infrastructure & Commodities · Green Supply & Recycling · Healthcare · Food Supply Resilience

Why Asia. Why now.

Medlife Solutions is built on a single conviction: Asia is in the middle of the largest, longest economic expansion in modern history, and the decade ahead is when it compounds. We do not chase deals opportunistically — we position ourselves along four structural currents that are already reshaping the region, and we go deep rather than wide.

2 bn → 3.5 bn

Asia's middle class, 2020 → 2030 (WEF)

2 in 3

Of the world's middle class will be Asian by 2030

51%

Of ASEAN's population will be middle class by 2030

USD 30 tn

Projected annual consumption across emerging Asia

Four forces, one direction

- Population scale — the region is still adding consumers, workers and households faster than anywhere else on earth.
- Rising middle class & consumerism — spending power is shifting from survival to discretionary, driving demand for housing, healthcare, food quality and mobility.
- Greater political & economic stability — deeper regional trade integration and more predictable policy environments are lowering the risk premium on long-cycle investment.
- A drive toward self-sufficiency — governments are reducing reliance on imports for food, energy, critical materials and healthcare capacity, opening space for regional suppliers.

How we act on it

- We sit between large developers, manufacturers and institutions and the raw materials, recycled feedstock and specialist services they need to execute.
- We focus on four sectors where demand is structurally under-supplied, not cyclically hot.
- We build direct relationships with private developers and operators on the ground, country by country, rather than trading at arm's length.
- Every engagement is chosen because it sits inside a decade-long trend we can point to with data — not because it is available.

OUR FOUR PILLARS

1 Infrastructure & Commodities 2 Green Supply & Recycling 3 Healthcare 4 Food Supply Resilience

Infrastructure & Commodities

Asia's governments are building at a scale the world has not seen before — roads, housing, ports, storage and power, driven directly by national policy. Every one of these projects consumes essential commodities at the base of the chain: cement, petroleum products, coal and aluminium. Medlife Solutions positions itself as the link between the private companies executing these projects and the raw material supply they depend on.

US\$1.7 tn / yr

Infrastructure investment needed across developing Asia to 2030 (ADB)

US\$26 tn

Total Asia infrastructure need, 2016–2030 (ADB)

61%

Of that investment need sits in East Asia alone

~US\$800 bn

Estimated annual funding gap vs. current investment levels

Where we are active

LOCATION	PROJECT	COMMODITIES WE SUPPLY
East Malaysia	Major road infrastructure connectivity works	Cement, aggregates, bitumen / petroleum-based binders
Batam, Indonesia	Prefabricated housing project serving the Singapore market	Cement, structural steel, aluminium
Palawan, Philippines	Commercial and residential housing development	Cement, steel, aluminium
Malacca, Malaysia	Oil storage facility development	Steel, petroleum products, industrial coatings
Central Kalimantan, Indonesia	100% foreign-owned coal mine. No export restrictions to supply China's steel mines.	Coal

In each case, our role is the same: we connect with the large private companies driving key infrastructure development and supply the essential commodities that let them execute — reliably, at scale, and on schedule.

Green Supply & Recycling

Materials are getting scarcer and regulation on manufacturers is tightening across Asia. Both push demand toward recycled and secondary raw materials — recycled plastics for China's expanding automotive sector, recovered metals from the electric-vehicle transition, and scrap aluminium for industry broadly. Medlife Solutions is building the buyer-side relationships to supply this demand with steady, quality-assured volume.

63% CAGR

China's EV battery recycling market, 2024–2030 (Grand View Research)

US\$2.7 bn

China EV battery recycling revenue by 2030, up from US\$87 m in 2023

1,100+ GWh

Annual APAC battery retirements by 2030, vs. 357 GWh in 2025

US\$278 bn

China's recycled battery-materials sales forecast by 2030 (Qianzhan)

What is driving demand

- China's retired EV power batteries are projected to grow from 1.04 million tonnes in 2025 to 3.5 million tonnes by 2030, creating a rapidly scaling feedstock stream.
- The global battery recycling market is forecast to grow from US\$26.3 bn (2025) to US\$46.6 bn by 2032, at an 8.5% CAGR.
- China's continued dominance in car manufacturing is lifting demand for recycled plastics in vehicle components and packaging.
- Tightening producer-responsibility and traceability regulation across the region is formalising and accelerating recycling flows.

Where Medlife adds value

- We connect buyers who need dependable, quality-graded volume with a fragmented, fast-formalising recycling supply base.
- Scrap aluminium sourcing for manufacturers seeking to reduce virgin-material dependence and carbon intensity.
- Recycled plastics supply aligned to the specifications of large-scale automotive and packaging manufacturers.
- EV battery material recovery streams, positioned ahead of the region's steep 2025–2030 retirement curve.

This is not a niche trade. It is a structural shift in how Asia's manufacturers source materials — and demand for steady, verified recycled supply is on a trajectory that will outpace virgin-material growth for the rest of the decade.

Healthcare

Asia is ageing faster than its healthcare systems are being built out. Demand for long-term care, hospital capacity and modern pharmaceutical distribution already outstrips supply in most of the region, and the gap widens every year. Medlife Solutions is building a Southeast Asia healthcare strategy around the three areas where the shortfall is most acute.

1.3 bn

Asians aged 60+ by 2050, up from 17.2% to 36.8% of the population

43%

Of older Asians with a functional limitation face a care gap (ADB)

22.9%

100 m / yr

People in the WHO-SEA region pushed into poverty by medical costs

Where we are active

TAIWAN → SE ASIA Long-term care strategy for the aged

Developing a Southeast Asia expansion strategy for long-term aged care with a major Taiwanese hospital group, bringing a proven care model into a region where 57% of over-60s already live with a diagnosed non-communicable disease, yet only 40% receive regular check-ups.

CAMBODIA Top-tier healthcare facility development

Coordinating with Cambodian developers to build top-tier healthcare facilities, addressing a market where formal hospital infrastructure has not kept pace with rising incomes and regional medical-travel demand.

MALAYSIA Pharmaceutical investment & logistics restructuring

Restructuring pharmaceutical investor and distribution logistics using AI-driven planning, improving reliability and cost of medicine supply chains as demand for modern pharmaceutical access grows.

Food Supply Resilience

Fresh, reliable food supply is becoming a strategic resource in its own right. Climate change and shrinking arable land are constraining production in food-importing nations, while producer countries face their own pressures — ageing farmers, land competition and yield risk. Medlife Solutions works with major producing countries to keep that supply line dependable for the countries that need it.

9 in 10

Grains of rice worldwide are grown in Asia

~1 in 3

Traded rice grains come from Thailand or Vietnam

10%

Potential cropland loss in ID, MY, PH & VN by 2028 without action

–10% yield

Estimated rice yield loss for every 1°C rise in max daily temperature

The pressure on supply

- Vietnam overtook Thailand as the world's second-largest rice exporter in H1 2025, shipping 4.72 million tonnes as production shifts across the region.
- The average rice farmer is now roughly 55 years old in Vietnam and 45 in Indonesia, with limited generational replacement.
- Climate volatility is already forcing export bans and trade restrictions elsewhere in the world, adding a geopolitical dimension to food security.

Our role

- We work directly with major fresh food producers in Vietnam and Thailand to supply importing Asian markets with consistent, quality-assured volume.
- We treat food supply as infrastructure — a resource that must be planned and secured years ahead, not sourced reactively.
- Countries with limited arable land and rising climate exposure are structurally reliant on partners who can guarantee continuity of supply.

How We Structure and Deliver

Two interdependent pillars that determine whether a trade moves from term sheet to successful settlement.

Trust	Funding Capacity
Built over 15+ years Proven through consistent, reliable execution across cycles — not claimed, demonstrated.	Liquidity is execution Without ready funding capacity, even the best-structured trade cannot close on time.
Personal relationships We leverage long-standing relationships in Taiwan, China and Southeast Asia rather than transactional channels.	Risk appetite clarity We understand our counterparties' risk appetite, funding costs and pressure points before structuring.
On-the-ground partners Key representatives in each major market who understand local demand or supply dynamics.	Appropriate trade design Structures are matched to available capital, tenor and security — never forced into a standard mould
Direct communication Personal, high-touch engagement with principals — the foundation of every successful structure.	Proven settlement track record Reliable funding and settlement history underpin the trust that unlocks larger and more complex deals.

A deliberate strategy, not a scattered one

Infrastructure, green supply, healthcare and food resilience are not four unrelated ventures — they are four expressions of the same thesis: Asia's population, income and stability are growing faster than its supply of essential materials and services. Medlife Solutions was built to sit inside that gap, country by country, sector by sector, for the decade ahead.
